

Compare response_time between the placebo and drug arms and tell me whether the difference is statistically significant.

已停止思考 >

I compared the response_time values between the placebo and drug arms using a two-sample Welch's t-test (which does not assume equal variances).

Group summaries

Arm	Mean response time	SD	n
Drug	4.10	5.22	30
Placebo	2.56	2.27	30

Statistical test

- Test: Welch two-sample t-test
- Test statistic: $t = 1.48$
- p-value: $p = 0.147$

Conclusion

The drug arm had a higher average response time than the placebo arm (4.10 vs 2.56), but the difference was **not statistically significant** at the conventional 0.05 significance level.

So, based on this dataset, there is insufficient evidence to conclude that the drug changes response time compared with placebo.
