↑ ...

Results

- Number of subjects: **25**
- Mean pre-intervention score: **48.49**
- Mean post-intervention score: **52.82**
- Mean change: **+4.32 points**

The paired t-test showed:

$$t(24) = 2.83, p = 0.009$$

Interpretation

Since the p-value (**0.009**) is less than the common significance level of 0.05, the change is **statistically significant**.

This suggests that the intervention was associated with a significant increase in scores from pre-test to post-test.
